

How to change the face of local energy

We aim to bring energy back under more local control to reduce prices and increase local economic benefits via a community enterprise. We aim to

- Develop local solar PV and AD systems
- Raise local capital via share issue to keep the benefits local
- Reduce costs for local householders and businesses
- Use the profits to help community issues

Local Energy for the Roseland Community

March 2023

Are you interested in cheaper local electricity?

The REACT solar PV and anaerobic digestion project is nearing the end of its first phase. We assessed potential local sites for renewable electricity, and found sites which are potentially available for solar PV, and/or suitable for small scale anaerobic digestion of farm wastes, and which can be connected to the grid.

We hope to develop these as community owned assets and sell the electricity locally at a lower price than imported generation.

READ ON for more information.....

Saving money and reducing emissions

Renewable electricity supplies

The Local Generation Tariff can help reduce our daytime electricity unit costs by up to 35% if we use electricity locally when it is being generated – ie when the sun is shining. This is worth every penny with high living costs persisting for some time to come.

Agricultural barn with solar PV

Dairy farm in Ireland

REACT is working on local supplies to suit the Roseland area and fit onto the local grid
